

A way to conserve water and increase our consciousness on our water consumption is by tracking our daily water consumption. Living in the world we are in today with technology playing such a vital and key role in our lives, creating an application that can be downloaded to our phones that gives us the capability of tracking our personal water consumption can go a long way. The idea is to attach a small extension to our household faucets that can easily connect and share data with our phone to easily monitor how much water we use throughout the day. Every time you use a water outlet, the smart attachment send the amount of liters you have consumed and the data is compiled on the app sending the user regular notifications on their consumption behavior. If the user exceeds the limit he or she has set as max for consumption, the phone vibrates signaling the users abuse of water. Additionally, when a warning is issued an image that is so moving and powerful appears to show the importance of taking care of our water consumption.
