

Rationalization of water consumption in toilets

Water is a blessing created by God to the universe, the Almighty said: " وجعلنا من الماء كلّ شيءٍ حيّ ". Water accounts for two-thirds of the earth's surface, two-thirds of human weight, and is the most important component of life. It is used to treat many diseases and health problems.

The Goal of the Idea

General rationalization of water, especially in the toilet because of flushing water in toilets one of the most way of wasting water, more than showering, washing clothes, or any other activities. accounting for nearly 30 percent of an average home's indoor water consumption.

The Idea is

By forcing everyone to place a piece of a balloon inside the toilet tank, the piece rationalizes by saving much of the wastewater.

The latrines, which have two types of water pump strong and weak, impose all who use the two button to only use the weak pump button by removing the big button from all toilets. As it is useful for those responsible for not to incur significant expenses to deliver water to the consumer and reduce the financial burden on families in the payment of less than the value of consumption.

I request that the idea of installing the guide pieces be circulated to everyone in all commercial and industrial centers, as well as government departments and mosques. and it should be at a cheap price, that everyone can install them in their toilets. Also there is many people do not know how they can get the guide tools to take the advantage of it in reducing the consumption. They must be available in specific distribution locations and advertised so that everyone can benefit from them. We need to unite the efforts of all those responsible in order to rationalize consumption and water conservation. in consideration that water is fundamental to any real development and ambition.

- My wish is not to win the competition my wish is to reduce the consumption of water to save our life.
