

# The Water Monitor

## **Introduction:**

Water is the most important aspect of life. Yet, we do not ever care about its source, or how much we consume. All we do is open the tap, and pay the bill at the end of the month. In many cases, we overconsume water or we just simply waste it. This phenomena has to come into an end, and that can happen with the help of the water monitor.

## **What is the Water Monitor?**

The water monitor is a small device that we fix on our main water distributor, we link the device to a mobile app, and watch the water usage each day or month. This way, we can be aware of how much water we really need, instead of wasting a lot. Also, a huge favor can be given by this device, is that it can monitor any invisible water leak in the wall tubes or anywhere else, and then notify you about the leak and its location, enabling you to fix it and save the water that is more valuable than gold.

## **Predicted cost:**

The predicted cost of such a device is around 70\$, but the amount of water you can save because of it is much higher.

**Save water...For your Kids...And Their Kids...**
